Leandro Vendramin

Galois theory

Notes

Thursday 11th November, 2021

Preface

The notes correspond to the bachelor course *Galois theory* of the Vrije Universiteit Brussel, Faculty of Sciences, Department of Mathematics and Data Sciences. The course is divided into thirteen two-hours lectures.

The material is somewhat standard. Basic texts on fields and Galois theory are for example [1]. . .

As usual, we also mention a set of great expository papers by Keith Conrad available at `https://kconrad.math.uconn.edu/blurbs/`. The notes are extremely well-written and are useful at at every stage of a mathematical career.

This version was compiled on Thursday 11^{th} November, 2021 at 16:00.

Lecture 1

§1. Fields

Recall that a **field** is a commutative ring such that $1 \neq 0$ and that every non-zero element is invertible. Examples of (infinite) fields are $\mathbb{Q}$, $\mathbb{R}$ and $\mathbb{C}$. If p is a prime number, then $\mathbb{Z}/p$ is a field.

Example 1.1. The abelian group $\mathbb{Z}/2\times\mathbb{Z}/2$ is a field with multiplication

$$(a,b)(c,d) = (ac+bd, ad+bc+bd).$$

Example 1.2. $\mathbb{Q}(i) = \{a+bi : a,b \in \mathbb{Q}\}$ and $\mathbb{Q}(\sqrt{2})$ are fields.

xca:Q(i) **Exercise 1.3.** Prove that $\mathbb{Q}(i)$ and $\mathbb{Q}(\sqrt{2})$ are not isomorphic as fields.

If R is a ring, there exists a unique ring homomorphism $\mathbb{Z} \to R$, $m \mapsto m1$. The image $\{m1 : m \in \mathbb{Z}\}$ of this homomorphism is a subring of R and it is known as the **ring of integers** of R. The kernel is a subgroup of $\mathbb{Z}$ and hence it is generated by some $t \in \mathbb{Z}$. The integer t is the **characteristic** of the ring R.

Exercise 1.4. The characteristic of a field is either zero or a prime number.

Recall that a commutative ring R is an **integral domain** if $xy = 0 \implies x = 0$ or $y = 0$. Fields are integral domains.

Exercise 1.5. Let K be a field. Prove that the following statements are equivalent:

1) K is of characteristic zero.
2) The additive order of 1 is infinite.
3) The additive order of each $x \neq 0$ is infinite.
4) The ring of integers of K is isomorphic to $\mathbb{Z}$.

Exercise 1.6. Let K be a field. Prove that the following statements are equivalent:

1) K is of characteristic p.

2) The additive order of 1 is p.
3) The additive order of each $x \neq 0$ is p.
4) The ring of integers of K is isomorphic to $\mathbb{Z}/p$.

The following exercise is important.

Exercise 1.7. Prove that if K is a finite field, then $|K| = p^m$ for some prime number p and some $m \geq 1$.

Definition 1.8. A **subfield** of a ring R is a subring of R that is also a field.

Note that if K is a subfield of E, then the characteristic of K coincides with the chacteristic of E. Moreover, if $K \to L$ is a field homomorphis, then K and L have the same characteristic.

Exercise 1.9. Let K be a field of characteristic p. Prove that $K \to K$, $x \mapsto x^{p^n}$, is a field homomorphism for all $n \in \mathbb{Z}_{\geq 0}$.

Note that finite fields are of characteristic p.

Let K be a subfield of a field E. Then E is a K-vector space with the usual scalar multiplication $K \times E \to E$, $(\lambda, x) \mapsto \lambda x$.

Definition 1.10. A field K is **prime** if there are no proper subfields of K.

Examples of prime fields are $\mathbb{Q}$ and $\mathbb{Z}/p$ for p a prime number.

Proposition 1.11. *Let K be a field. The following statements hold:*

*1) K contains a unique prime field, it is known as the **prime subfield** of K.*
2) The prime subfield of K is either isomorphic to $\mathbb{Q}$ if the characteristic of K is zero, or it is isomorphic to $\mathbb{Z}/p$ for some prime number p if the characteristic of K is p.

Proof. To prove the first claim let L be the intersection of all the subfields of K. Then L is a subfield of K. If F is a subfield of L, then F is a subfield of K. Thus $L \subseteq F$ and hence $F = L$, which proves that L is prime. If L_1 is a subfield of K and L_1 is prime, then $L \subseteq L_1$ and hence $L = L_1$.

Let K_0 be the prime field of K. Suppose that K is of characteristic $p > 0$. Then the ring $K_{\mathbb{Z}}$ of integers of K is a field isomorphic to $\mathbb{Z}/p$ and hence $K_0 \simeq K_{\mathbb{Z}}$. Suppose now that the characteristic of K is zero. Let $L = \{m1/n1 : m, n \in \mathbb{Z}, n \neq 0\}$. We claim that $K_0 = L$. Since $K_{\mathbb{Z}} \subseteq K_0$, it follows that $L \subseteq K_0$. Hence $L = K_0$, as L is a subfield of K. □

Definition 1.12. Let E be a field and K be a subfield of E. Then E is an **extension** of K. We will use the notation E/K.

If E is an extension of K, then E is a K-vector space.

Definition 1.13. The degree of an extension E of K is the integer $\dim_K E$. It will be denoted by $[E : K]$.

We say that E is a finite extension of K if $[E : K]$ is finite.

Example 1.14. Let K be a field. Then $[K : K] = 1$. Conversely, if E is an extension of K and $[E : K] = 1$, then $K = E$. If not, let $x \in E \setminus K$. We claim that $\{1, x\}$ is linearly independent over K. Indeed, if $a1 + bx = 0$ for some $a, b \in K$, then $bx = -a$. If $b \neq 0$, then $x = -a/b \in K$, a contradiction. If $b = 0$, then $a = 0$.

We know that $[\mathbb{C} : \mathbb{R}] = 2$.

Example 1.15. A basis of $\mathbb{Q}(\sqrt{2})$ over $\mathbb{Q}$ is given by $\{1, \sqrt{2}\}$. Then $[\mathbb{Q}(\sqrt{2}) : \mathbb{Q}] = 2$.

Example 1.16. Since $\mathbb{Q}$ is numerable and $\mathbb{R}$ is not, $[\mathbb{R} : \mathbb{Q}] > \aleph_0$. If $\{x_i : i \in \mathbb{Z}_{>0}\}$ is a numerable basis of $\mathbb{R}$ over $\mathbb{Q}$, for each n consider the $\mathbb{Q}$-vector space V_n generated by $\{x_1, \dots, x_n\}$. Then

$$\mathbb{R} = \bigcup_{n \geq 1} V_n,$$

is numerable, as each V_n is numerable, a contradiction.

If E is an extension of K and E is finite, then $[E : K]$ is finite.

Proposition 1.17. *Let K be a finite field. Then $|K| = p^m$ for some prime number p and some $m \geq 1$.*

Proof. We know that the prime subfield of K is isomorphic to $\mathbb{Z}/p$. In particular, $|K_0| = p$. Since K is finite, $[K : K_0] = m$ for some m. If $\{x_1, \dots, x_m\}$ is a basis of K over K_0, then each element of K can be written uniquely as $\sum_{i=1}^{m} a_i x_i$ for some $a_1, \dots, a_m \in K_0$. Then $K \simeq K_0^m$ and hence $|K| = |K_0^m| = p^m$. □

Definition 1.18. Let E be an extension of K. A **subextension** F of K is a subfield F of E that contains K, that is $K \subseteq F \subseteq E$.

Definition 1.19. Let E and E_1 be extensions over K. An extension **homomorphism** $E \to E_1$ is a field homomorphism $\sigma \colon E \to E_1$ such that $\sigma(x) = x$ for all $x \in K$.

To describe the homomorphism $\sigma \colon E \to E_1$ of the extensions over K one typically writes the commutative diagram

$$\begin{tikzcd} K \arrow[r, equal] \arrow[d, hook] & K \arrow[d, hook] \\ E \arrow[r, "\sigma"] & E_1 \end{tikzcd}$$

We write $\mathrm{Hom}(E/K, E_1/K)$ to denote the set of homomorphism $E \to E_1$ of extensions of K. Note that if $\sigma \in \mathrm{Hom}(E/K, E_1/K)$, then σ is a K-linear map, as

$$\sigma(\lambda x) = \sigma(\lambda)\sigma(x) = \lambda\sigma(x)$$

for all $\lambda \in K$ and $x \in E$.

Example 1.20. The conjugation map $\mathbb{C} \to \mathbb{C}$, $z \mapsto \overline{z}$, is an endomorphism of $\mathbb{C}$ as an extension over $\mathbb{R}$. Let $\varphi \in \mathrm{Hom}(\mathbb{C}/\mathbb{R}, \mathbb{C}/\mathbb{R})$. Then

$$\varphi(x+iy) = \varphi(x) + \varphi(i)\varphi(y) = x + \varphi(i)y$$

for all $x, y \in \mathbb{R}$. Since $\varphi(i)^2 = \varphi(i^2) = \varphi(-1) = -1$, it follows that $\varphi(i) \in \{-i, i\}$. Thus either $\varphi(x+iy) = x+iy$ or $\varphi(x+iy) = x-iy$.

Exercise 1.21. Prove that if K is a field and $\sigma\colon K \to K$ is a field homomorphism, then $\sigma \in \mathrm{Hom}(K/K_0, K/K_0)$.

If E/K is an extension, then

$$\mathrm{Aut}(E/K) = \{\sigma : \sigma\colon E \to E \text{ is a bijective extension homomorphism}\}$$

is a group with composition.

Definition 1.22. Let E/K be an extension. The **Galois group** of E/K is the group $\mathrm{Aut}(E/K)$ and it will be denoted by $\mathrm{Gal}(E/K)$.

A typicall example: $\mathrm{Gal}(\mathbb{C}/\mathbb{R}) \simeq \mathbb{Z}/2$.

Example 1.23. Let $\theta = \sqrt[3]{2}$ and let $E = \{a + b\theta + c\theta^2 : a, b, c \in \mathbb{Q}\}$. Note that

$$a + b\theta + c\theta^2 = 0 \Longleftrightarrow a = b = c = 0.$$

In fact, if $abc \neq 0$, then $aX^2 + bX + c \neq 0$ and thus $X^3 - 2 = q(X)(aX^2 + bX + c) + r(X)$ for some polynomials $q(X) \in \mathbb{Q}[X]$ and $r(X) = eX + f \in \mathbb{Q}[X]$. Evaluate in θ to obtain that $r(\theta) = 0$ and hence $r(X) = 0$ in $\mathbb{Q}[X]$. This implies that $aX^2 + bX + c$ divides $X^3 - 2$, a contradiction since $X^3 - 2$ is irreducible in $\mathbb{Q}[X]$.

Then E is an extension of $\mathbb{Q}$ such that $[E : \mathbb{Q}] = 3$. We claim that $\mathrm{Gal}(E/\mathbb{Q})$ is trivial. If $\sigma \in \mathrm{Gal}(E/\mathbb{Q})$ and $z = a + b\theta + c\theta^2$, then $\sigma(z) = a + b\sigma(\theta) + c\sigma^2(\theta)$. Since $\sigma(\theta)^3 = \sigma(\theta^3) = \sigma(2) = 2$, it follows that $\sigma(\theta) = \theta$ and therefore $\sigma = \mathrm{id}$.

If E/K is an extension and S is a subset of E, then there exists a unique smallest subextension F/K of E/K such that $S \subseteq F$. In fact,

$$F = \bigcap \{T : T \text{ is a subfield of } E \text{ that contains } K \cup S\}$$

If L/K is a subextension of E/K such that $S \subseteq L$, then $F \subseteq L$ by definition. The extension F is known as the **subextension generated by** S and it will be denoted by $K(S)$. If $S = \{x_1, \dots, x_n\}$ is finite, then $K(S) = K(x_1, \dots, x_n)$ is said to be of **finite type**.

Example 1.24. If $\{e_1, \dots, e_n\}$ is a basis of E over K, then $E = K(e_1, \dots, e_n)$.

Example 1.25. The field $\mathbb{Q}(\sqrt{2})$ is precisely the extension of $\mathbb{R}/\mathbb{Q}$ generated by $\sqrt{2}$.

Let E/K be an extension and S and T be subsets of E. Then

$$K(S \cup T) = K(S)(T) = K(T)(S).$$

If, moreover, $S \subseteq T$, then $K(S) \subseteq K(T)$.

§2. Algebraic extensions

Definition 2.1. Let E/K be an extension. An element $x \in E$ is **algebraic** over K if there exists a non-zero polynomial $f(X) \in K[X]$ such that $f(x) = 0$. If x is not algebraic over K, then it is called **trascendent** over K.

If E/K is an extension, then

$$\overline{K}_E = \{x \in E : x \text{ is algebraic over } K\}$$

is the **algebraic closure** of K in E.

Definition 2.2. An extension E/K is **algebraic** if every $x \in E$ is algebraic over K.

If K is a field, every $x \in K$ is algebraic over K, as x is a root of $X - x \in K[X]$. In particular, K/K is an algebraic extension.

Example 2.3. $\mathbb{C}/\mathbb{R}$ is an algebraic extension. If $z \in \mathbb{C} \setminus \mathbb{R}$, then z is a root of the polynomial $X^2 + (z + \overline{z})X + |z|^2 \in \mathbb{R}[X]$.

If F/K is an algebraic extension and $x \in E$ is algebraic over K, then x is algebraic over E.

Example 2.4. $\mathbb{Q}(\sqrt{2})/\mathbb{Q}$ is algebraic, as the number $a + b\sqrt{2}$ is a root of the polynomial $X^2 - 2aX + (a^2 - 2b^2) \in \mathbb{Q}[X]$.

The extension $\mathbb{C}/\mathbb{Q}$ is not algebraic.

If E/K is an extension and $x \in E$ is algebraic over K, then the evaluation homomorphism $K[X] \to E$, $f \mapsto f(x)$, is not injective. In particular, its kernel is a non-zero ideal and hence it is generated by a monic polynomial f.

Definition 2.5. Let E/K be an extension and $x \in E$ be an algebraic element. The monic polynomial that generates the kernel of $K[X] \to E$, $f \mapsto f(x)$, is known as the **minimal polynomial** of x over K and it will be denoted by $f(x,K)$. The **degree** of x over K is then $\deg f(x,K)$.

Some basic properties of the minimal polynomial of an algebraic element:

Proposition 2.6. *Let E/K be an extension and $x \in E$.*

1) *If $g \in K[X]$ is such that $g(x) = 0$, then $f(x,K)$ divides g.*

2) *If* $g(x)=0$ *and* $g\neq 0$*, then* $\deg g \geq \operatorname{gr} f(x,K)$.
3) $f(x,K)$ *is irreducible in* $K[X]$.
4) *If* $g(x)=0$ *and* $g(X)$ *is monic and irreducible, then* $g=f(x,K)$.
5) *If* F/K *is a subextension of* E/K*, then* $f(x,F)$ *divides* $f(x,K)$.

Proof. Write $f=f(x,K)$ to denote the minimal polynomial of x. To prove 1) note that $g(x)=0$ implies that g belongs to the kernel of the evaluation map, so g is a multiple of f. Now 2) follows from 1). To prove 3) note that if $f=gh$ for some $g,h\in K[X]$ such that $0<\deg g,\deg h<\deg f$, then $f(x)=0$ implies that either $g(x)=0$ or $h(x)=0$, a contradiction. 4) is trivial. Finally we prove 5). Since $f\in K[X]\subseteq F[X]$ and $f(x)=0$, it follows from 3) that $f(x,F)$ divides f. □

Some easy examples: $f(i,\mathbb{R})=X^2+1$ and $f(\sqrt[3]{2},\mathbb{Q})=X^3-2$.

Example 2.7. Let us compute $f(\sqrt{2}+\sqrt{3},\mathbb{Q})$. Let $\alpha=\sqrt{2}+\sqrt{3}$. Then

$$\begin{aligned}\alpha-\sqrt{2}=\sqrt{3} &\implies (\alpha-\sqrt{2})^2=3 \implies \alpha^2-2\sqrt{2}\alpha+2=3\\ &\implies \alpha^2-1=2\sqrt{2}\alpha \implies (\alpha^2-1)^2=8\alpha^2 \implies \alpha^4-10\alpha^2+1=0.\end{aligned}$$

Thus α is a root of $g=X^4-10X^2+1$. To prove that $g=f(\alpha,\mathbb{Q})$ it is enough to prove that g is irreducible in $\mathbb{Q}[X]$. First note that the roots of g are $\sqrt{2}+\sqrt{3}$, $\sqrt{2}-\sqrt{3}$, $-\sqrt{2}+\sqrt{3}$ and $-\sqrt{2}-\sqrt{3}$. This means that if g is not irreducible, then $g=hh_1$ for some polynomials $h,h_1\in\mathbb{Q}[X]$ such that $\deg h=\deg h_1=2$. This is not possible, as $(\sqrt{2}+\sqrt{3})+(\sqrt{2}-\sqrt{3})=2\sqrt{2}\notin\mathbb{Q}$, $(\sqrt{2}+\sqrt{3})+(-\sqrt{2}+\sqrt{3})=2\sqrt{3}\notin\mathbb{Q}$ and $(\sqrt{2}+\sqrt{3})(-\sqrt{2}-\sqrt{3})=-5-2\sqrt{6}\notin\mathbb{Q}$.

Proposition 2.8. *Let* F/K *be a subextension and* E/K*. Then*

$$[E:K]=[E:F][F:K].$$

Proof. Let $\{e_i : i\in I\}$ be a basis of E over K and $\{f_j : j\in J\}$ be a basis of F over K. If $x\in E$, then $x=\sum_i \lambda_i e_i$ (finite sum) for some $\lambda_i\in F$. For each i, $\lambda_i=\sum_j a_{ij}f_j$ (finite sum) for some $a_{ij}\in K$. Then $x=\sum_i\sum_j a_{ij}(f_je_i)$. This means that $\{f_je_i : i\in I, j\in J\}$ generates E as a K-vector space. Let us prove that $\{f_je_i : i\in I, j\in J\}$ is linearly independent. If $\sum_i\sum_j a_{ij}(f_je_i)=0$ (finite sum) for some $a_{ij}\in K$, then

$$\begin{aligned}0=\sum_i\left(\sum_j a_{ij}f_j\right)e_i &\implies \sum_j a_{ij}f_j=0 \text{ for all } i\in I\\ &\implies a_{ij}=0 \text{ for all } i\in I \text{ and } j\in J.\end{aligned}$$

□

We state a lemma:

Lemma 2.9. *If* A *is a finite-dimensional commutative algebra over* K *and* A *is an integral domain, then* A *is a field.*

Proof. Let $a \in A \setminus \{0\}$. We need to prove that there exists $b \in A$ such that $ab = 1$. Let $\theta\colon A \to A$, $x \mapsto ax$. Clearly θ is an algebra homomorphism. It is injective, since A is an integral domain. Since $\dim_K A < \infty$, it follows that θ is an isomorphism. In particular, $\theta(A) = A$, which means that there exists $b \in A$ such that $1 = ab$. ◻

Theorem 2.10. *Let E/K be an extension and $x \in E \setminus K$. The following statements are equivalent:*

1) *x is algebraic over K.*
2) $\dim_K K[x] < \infty$.
3) *$K[x]$ is a field.*
4) *$K[x] = K(x)$.*

Proof. We first prove 1) $\implies$ 2). Let $z \in K[x]$, say $z = h(x)$ for some $h \in K[X]$. There exists $g \in K[X]$ such that $g \neq 0$ and $g(x) = 0$. Divide h by g to obtain polynomials $q, r \in K[X]$ such that $h = gq + r$, where $r = 0$ or $\deg r < \deg g$. This implies that

$$z = h(x) = g(x)q(x) + r(x) = r(x).$$

If $\deg g = m$, then $r = \sum_{i=0}^{m-1} a_i X^i$ for some $a_0, \dots, a_{m-1} \in K$. Thus $z = \sum_{i=0}^{m-1} a_i x^i$, so $K[x] \subseteq \langle 1, x, \dots, x^{m-1} \rangle$.

The previous lemma proves that 2) $\implies$ 3).

It is trivial that 3) $\implies$ 4).

It remains to prove that 4) $\implies$ 1). Let us prove that $K(x) \subseteq K[x]$. Since $x \neq 0$, $1/x \in K[x]$. There exists $a_0, \dots, a_n \in K$ such that $1/x = a_0 + a_1 x + \dots + a_n x^n$. Thus

$$a_n x^{n+1} + \dots + a_1 x^2 + a_0 x - 1 \neq 0$$

and x is a root of $a_n X^{n+1} + \dots + a_0 X - 1 \in K[X]$. ◻

Note that if x is algebraic over K, then $K[x] \simeq K[X]/(f(x,K))$.

Corollary 2.11. *If E/K is finite, then E/K is algebraic.*

Proof. Let $n = [E : K]$ and $x \in E$. The set $\{1, x, \dots, x^n\}$ is linearly dependent, so there exist $a_0, \dots, a_n \in K$ not all zero such that $a_0 + a_1 x + \dots + a_n x^n = 0$. Thus x is a root of the non-zero polynomial $a_0 + a_1 X + \dots + a_n X^n \in K[X]$. ◻

We note that the converse of the previous corollary does not hold.

Corollary 2.12. *If E/K is an extension and $x_1, \dots, x_n \in E$ are algebraic over K, then $K(x_1, \dots, x_n)/K$ is finite and $K(x_1, \dots, x_m) = K[x_1, \dots, x_n]$.*

Proof. We proceed by induction on n. The case $n = 1$ follows immediately from the theorem. So assume the result holds for some $n \geq 1$. . . . ◻

Corollary 2.13. *Let $E = K(S)$. Then E/K is algebraic if and only if x is algebraic over K for all $x \in S$.*

Proof. Let us prove the non-trivial implication. Let $z \in K(S)$. In particular, there exists a finite subset $T \subseteq S$ such that $z \in K(T)$. The previous corollary implies that $K(T)/K$ is algebraic and hence z is algebraic. $\square$

Corollary 2.14. *If E/K is an extension, then $\overline{K}_E$ is a subfield of E that contains K. Moreover, $K(\overline{K}_E)/K$ is algebraic.*

Proof. $\square$

Corollary 2.15.

Algebraic field extensions form a nice class of extensions. The same happens with finite field extensions.

Proposition 2.16. *Let F/K is a subextension of E/K. Then E/K is algebraic (resp. finite) if and only if E/F and F/K are algebraic (resp. finite).*

Proof. $\square$

Proposition 2.17. *Let E/K and F/K be extensions, where both E and F are subfields of a field L. If F/K is algebraic (resp. finite), then EF/E is algebraic (resp. finite).*

Proof. $\square$

Lemma 2.18. *Let $\sigma\colon K \to L$ be a field homomorphism. Then there exists an extension E/K and a field isomorphism $\varphi\colon E \to L$ such that the diagram*

$$\cdots$$

commutes, that is $\varphi|_K = \sigma$.

Proof. $\square$

Theorem 2.19. *Let K be a field and $f \in K[X]$ be such that* $\deg f > 0$. *Then there exists an extension E/K such that f admits a root in E.*

Proof. $\square$

As a corollary, if K is a field and $f_1, \dots, f_n \in K[X]$ are polynomials of positive degree, then there exists an extension E/K such that each f_i admits a root in E. This is proved by induction on n.

Definition 2.20. A field K is **algebraically closed** if each $f \in K[X]$ of positive degree admits a root in K.

The *fundamental theorem of algebra* states that $\mathbb{C}$ is algebraically closed. A typical proof uses complex analysis. Later we will give a proof of this result using Galois theory.

Proposition 2.21. *The following statements are equivalent:*

1) *K is algebraically closed.*
2) *If $f \in K[X]$ is irreducible, then* $\deg f = 1$.
3) *If $f \in K[X]$ is non-zero, then f decomposes linearly in $K[X]$, that is*

$$f = a\prod_{i=1}^{n}(X-\alpha_i)^{m_i}$$

for some $a \in K$ and $\alpha_1, \dots, \alpha_n \in K$.
4) *If E/K is algebraic, then $E = K$.*

Proof. 1) $\implies$ 2 $\implies$ 3) are exercises. Let us prove that 3) $\implies$ 4). Let $x \in E$. Decompose $f(x,K)$ linearly in $K[X]$ as $f(x,K) = a\prod_{i=1}^{n}(X-\alpha_i)$ and evaluate on x to obtain that $x = \alpha_j$ for some j. To prove that 4) $\implies$ 1) . . . □

Proposition 2.22. *Let C be algebraically closed and $\sigma\colon K \to C$ be a field homomorphism. If E/K is algebraic, then there exists a field homomorphism $\varphi\colon E \to C$ such that the diagram*

$$\dots$$

commutes, that is $\varphi|_K = \sigma$.

Proof. □

Definition 2.23. The **algebraic closure** of a field K is an algebraic extension C/K such that C is algebraically closed.

For example, $\mathbb{C}/\mathbb{R}$ is an algebraic closure but $\mathbb{C}/\mathbb{Q}$ it is not.

§3. Artin's theorem

Theorem 3.1 (Artin). *Let K be a field. Then K admits an algebraic closure C/K. If C_1/K is an algebraic closure, then the extensions C/K and C_1/K are isomorphic.*

Proof. □
